Pelvic lipomatosis with cystitis glandularis managed by cyclooxygenase-2 inhibitor:

A case report

Mo LC *et al.* Pelvic lipomatosis with cystitis glandularis

Abstract

BACKGROUND

1 Pelvic lipomatosis (PL) is a rare benign condition with characteristic overgrowth of histologically benign fat and invasion and compression of pelvic organs, often leading to non-specific lower urinary tract symptoms (LUTS). Approximately 40% of patients with PL have cystitis glandularis (CG). The cause of PL combined with CG is poorly understood, and there is currently no effective treatment. Refractory CG with upper urinary tract obstruction even requires partial or radical bladder resection.

https://www.researchgate.net/publication/265472351_Cystitis_glandularis_A...

Cystitis glandularis, cystica or follicularis has been observed in 75% of the patients with pelvic lipomatosis. Although cystitis glandularis is widely regarded as premalignant few reports have ...

Cystitis Glandularis (Glandular Cystitis): Symptoms ...

[https://www.symptoma.com/en/info/cystitis-glandularis ▾](https://www.symptoma.com/en/info/cystitis-glandularis)

Cystitis glandularis is a term denoting the transformation of the transitional epithelium of the urinary bladder into columnar, presumably due to irritation by infectious agents, stones, neoplastic disorders or other processes. The eventual formation of cysts can lead to symptoms resembling a urinary tract infection - abdominal pain, hematuria, dysuria, nocturia, increased urinary frequency, etc.

MalaCards based summary: Glandular Cystitis, also known as cystitis glandularis, is related to chronic cystitis and cystitis. An important gene associated with Glandular Cystitis is UCA1 (Urothelial Cancer Associated 1), and among its related pathways/superpathways are Adhesion and Cytoskeletal Signaling. Affiliated tissues include testes, prostate and colon.
