Title: Observation on the efficacy of different antibiotics in the treatment of children with respiratory mycoplasma infection

Author: Meiyong Zhang¹, Yan Zhao², Jinfeng Liu³, Guoping Liu⁴, Ruiyun Zhang⁵, Limin Wang⁶

Name of Journal: World Journal of Clinical Cases

Manuscript NO: 63189

First of all, thank you for your careful guidance of this article. Revision has been made according to the suggestions of the reviewer:

Reviewer: 03507584

Human lung function and immune function are worse in childhood, children are more susceptible to infection with *Mycoplasma pneumoniae*. *Mycoplasma* pediatric infection is a common pediatric respiratory infection in clinical practice. The commonly used drug for pediatric mycoplasma infection is erythromycin, which is efficient in killing mycoplasma. The clarithromycin has been gradually applied to the treatment of mycoplasma infection-related diseases. In this brief study, the authors provide a comprehensive review to investigate the clinical value of clarithromycin in the treatment of pediatric respiratory mycoplasma infection. This study overall is well designed. The inclusion and exclusion criteria are reasonable, and clear. The results are interesting, and well discussed. The reviewer suggests to accept this manuscript after a minor editing.

Thank you for your advice.

After receiving the comments, we read the article carefully, found some small loopholes in the language of the article and made modifications. Then we added a background section to the abstract.

Thank you again for publishing our manuscript in the World Journal of Clinical Cases.

Sincerely Yours,

Limin Wang
