Red reflex

The red reflex refers to the reddish-orange reflection of light from the back of the eye, or fundus, observed when using an ophthalmoscope or retinoscope. The reflex relies on the transparency of optical media and reflects off the fundus back through

An essential component of any eye examination in an infant or child, the red reflex test is an evaluation of **reflected light off the ocular fundus**. A direct ophthalmoscope, set to a lens power of "0," is projected onto both eyes from a distance of 18 inches. A red image, symmetrical from both eyes, should be visible.

Evaluation of the Red Reflex: an overview for the pediatrician

Aspasia Toli, Asli Perente, Georgios Labiris

Abstract

BACKGROUND

Red Reflex Test (RRT) is a simple, non-invasive method that can be performed easily by pediatricians during the clinical examination in neonatal period, infancy and childhood.
