Portal hypertension

SymptomsDiagnosis>

Portal hypertension is abnormally increased portal venous pressure – blood pressure in the portal vein and its branches, that drain from most of the intestine to the liver. Portal hypertension is defined as a hepatic venous pressure gradient greater than 5 mmHg. Cirrhosis is the most common cause of portal hypertension; other, less frequent causes are therefore grouped as non-cirrhotic portal hypertension. When it becomes severe enough to cause

Pathophysiology of Portal Hypertension
https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3971388
Abstract. Portal hypertension is a major complication of liver disease, which results from a variety of pathological conditions that increase the resistance to the portal blood flow into the liver. The primary cause of portal hypertension in cirrhosis is an increase in intrahepatic vascular resistance due to massive structural changes associated with fibrosis and increased vascular tone in the hepatic microcirculation.

Increases in the intrahepatic vascular resistance (IHVR) occur because of mechanical (fibrosis in the sinusoids, microthrombi in hepatic veins, and regenerative nodule formation) and dynamic (failure of sinusoidal relaxation) obstructive processes within the liver.

Jul 16, 2020 Secondary to ligamentous laxity, the spleen is attached by a long pedicle containing the splenic vessels and, often, the pancreatic tail, and consequently, the spleen is prone to torsion and infarction [1]. Clinical diagnosis of wandering spleen is difficult due to its rarity and nonspecific presenting symptoms.

Torsion of spleen and portal hypertension: Pathophysiology and clinical implications

Jha AK *et al.* Torsion of spleen and portal hypertension

Ashish Kumar Jha, Sameer Bhagwat, Vishwa Mohan Dayal, Arya Suchismita

Abstract

The displacement of spleen from its normal location to other places is known as wandering spleen (WS) and is a rare disease. The repeated torsion of WS is due to the presence of long pedicle and absence/laxity of anchoring ligaments. A WS is an extremely rare cause of left-sided portal hypertension (PHT) and severe gastric variceal bleeding. Left-sided PHT usually occurs as a result of splenic vein occlusion caused by splenic torsion, extrinsic compression of the splenic pedicle by enlarged spleen, and

Abstract. **Portal hypertension** is a major complication of liver disease, which results from a variety of pathological conditions that increase the resistance to the **portal** blood flow into the liver. The primary cause of **portal hypertension** in cirrhosis is an increase in intrahepatic vascular resistance due to massive structural changes associated with fibrosis and increased vascular tone in the hepatic ...
