## Unhealthy Alcohol Use, HIV Infection and Risk of Liver ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3467291>

The main contribution of the study is related to the fact that **unhealthy alcohol** use had a differential effect on FIB-4 values if **patients** have **hepatitis C** alone or HCV/HIV coinfection. **Unhealthy alcohol drinking** has been regarded as a major contributor to the progression of **liver disease** in the setting of **chronic hepatitis C** [27] and, a synergistic effect between HCV and alcohol has been proposed [28].

<https://www.ncbi.nlm.nih.gov/pubmed/22493553>

Mar 28, 2012 - Liver stiffness was significantly higher in patients with HCC than in those without in each duration group (P < 0.0001). The factors significantly associated with high liver stiffness in multiple regression were age at blood transfusion (P < 0.0001), duration of infection (P = 0.0015), and heavy alcohol consumption (P = 0.043).

In HCV cases, heavy alcohol use has been associated with **more severe fibrosis**, but even low rates of use may have deleterious effects. Patients with chronic hepatitis C and alcoholic liver disease can be cured of the HCV –theoretically positively impacting outcome and reducing the need for liver transplantation.
