Abstract Introduction Case Report Discussion Conclusion

Schwannomas (**Neurilemmomas**) are benign, encapsulated, slow-growing, and usually solitary tumours originating from Schwann cells of the peripheral nerve sheath with uncertain etiology. Approximately 25-48% of cases are seen in the head and neck region, of which 1% appears in the oral cavity. Lingual schwannoma can affect all age groups with peak incidence between the third and sixth decade. We report a rare case of lingual schwannoma in a 14-year-old girl complaining of asymptomatic swelling ov...

Jul 26, 2020 · Schwannomas in the oral cavity are relatively rare. We experienced a 28-year-old woman with a protruding schwannoma of the sublingual surface. Few of the features of this tumor are specified. It is important to understand the clinicopathological features of tongue schwannoma. So, we reviewed both Japanese and international literature on ...

94 rows · Although several cases of malignant transformation of head and neck schwannomas have been reported, the single case of malignant tumor occurring in the anterior tongue of an 18-year-old woman was the only case identified during our literature search 48. In this context, complete removal of the tumor is important to avoid recurrence.
