Muscular cirrhosis is the wasting of muscles due to liver disease. Wasting of muscles is also referred to as **Sarcopenia** which can also be viewed as severe depletion of the muscles. This abnormality in the muscles is common for people suffering from cirrhosis and can be a critical factor if and when patients decide to avail themselves of liver transplantation .

**Muscle cramps** are painful, involuntary contractions of skeletal muscle. They occur frequently in individuals with cirrhosis, regardless of the etiology, and are thought to be a symptom of cirrhotic-stage liver disease. The pathophysiology of these cramps remains elusive; hence, a specific therapy has not been identified.
