Title: Benign focal liver lesion: the role of Magnetic Resonance Imaging

Reply to reviewers' comments:

In the manuscript by Marco Gatti et. Al., Benign liver lesions are evaluated on magnetic resonance imaging. I believe that the article addresses very well the aspects of the objective of the work, but what would be important to address in more depth the contrasts (some under development) such as those developed from metallic nanoparticles, functionalized nanoparticles that allow for specificity and high sensitivity. It needs to be summarized the findings of the article in the form of a table in order to better show the results found.

Thank you for your comment. Following your suggestion, we added a table summarizing the most commonly used contrast media in clinical practice.

Moreover, thank you for the suggestion to summarize the article's findings in a table. We actually did it with figure 1 and thus we decided to keep Figure 1 as the summary, which we believe is visually more effective than a table.
