Manuscript NO: 67431

First of all, thank you for your careful guidance of this article. Revision has been made according to the suggestions of the reviewer:

Reviewer: 06086674

In this retrospective study, the Authors analyzed the effect of Endu combined with concurrent radiotherapy and chemotherapy in the treatment of advanced cervical squamous cell carcinoma of 120 patients, providing a basis for clinical selection of treatment for advanced cervical cancer. The study is set up correctly. The material studied allows to draw the conclusions. The paper is written well, the Introduction give a good overview about the study background and the authors raised clearly the hypothesis of the study. The description of material studied is accurate. The aim of the study is fulfilled. The material studied is large enough and allows to draw the conclusions. I have a minor suggestion; the results section should not only be described in the Tables but need to describe the important results in detail. In general, the article provides an essential reference for researchers in this field and the results are interesting and could be useful for other studies. I recommend that the manuscript can be published.

First, we revised the minor language issues in the manuscript and revised the format of the table part. Secondly, we corrected small errors in the picture. Finally, in the results part, in addition to the description in the table, we also described the important results in detail.

Thank you again for publishing our manuscript in the World Journal of Clinical Cases.

Sincerely Yours,

Liyang Gao
