A misplaced peripherally inserted central catheter ...

<https://casereports.bmj.com/content/2018/bcr-2018-224471>

Apr 17, 2018

A preterm neonate born at 27 weeks, with a birth weight of 555 g, was on continuous positive airway pressure (CPAP) for apnoea of prematurity and initially received total parenteral nutrition (TPN) through the umbilical venous catheter. Peripherally inserted central catheter (PICC) was inserted in the left basilica vein on day 8 to continue TPN.

Mar 27, 2015

Peripherally inserted central venous catheters are commonly used in neonatal practice for delivery of parenteral nutrition, medications and other i.v. solutions. This mode of cannulation avoids risks involved in direct surgical/percutaneous access of the central veins in very sick and often premature neonates. 1 The recommended sites for ...

Double superior vena cava with a persistent left superior ...

<https://www.ncbi.nlm.nih.gov/pubmed/17991079>

We describe a case of double superior vena cava with a persistent left-sided superior vena cava discovered at the time of peripherally inserted central catheter (PICC) placement. The diagnosis was suggested by fluoroscopy and confirmed by venography. The relevance of the diagnosis with respect to PICC placement is discussed. PMID: 17991079
