< Abstract Introduction Patients and Methods Results Discu >

The causes of pancreatitis are largely dominated by gallstones and alcohol. Primary hyperparathyroidism (PHPT) is rarely associated with the development of pancreatitis. It is considered as well a cause of acute or chronic pancreatitis (AP or CP). Hypercalcemia secondary to the secretion of parathyroid hormone (PTH) plays a major role in the pathogenesis, but other mechanisms may be involved. The manifestations are polymorphic. We report five cases of pancreatitis revealing PHPT.
