Dear editor,

Please find attached files of revised manuscript in word format

LCP + T-type steel plate for postoperative weight bearing and functional recovery in complex tibial plateau fractures

Author: Haifeng Li¹, Tao Yu², Xingfei Zhu³, Hua Wang⁴, Yingqi Zhang⁵

Name of Journal: World Journal of Clinical Cases

Manuscript NO: 70244

First of all, thank you for your careful guidance of this article. Revision has been made according to the suggestions of the reviewer:

Reviewer: 05537639

Anatomical reduction, firm and stable fixation, and early training are the clinical treatment criteria for complex tibial plateau fractures. The operational treatment requires good biomechanical function, anatomical reduction of the articular surface, and reduction of soft tissue damage. Double plate internal fixation was used in the clinic; however, more soft tissue needs to be stripped during the operation, resulting in more postoperative complications. In this study, locking compression plate and T-shaped steel plate limited internal fixation was used to treat complex tibial plateau fractures to determine a more reliable internal fixation method for use in the clinic. The study design is good, and the inclusion criteria is described in detail. Operation methods are reasonable. So minor language polishing should be corrected. And the references should be edited and updated.

Thank you for your advice.

After receiving the comments, We read the article in detail, polished the

language and edited references.

Thank you again for publishing our manuscript in the World Journal of Clinical Cases.

Sincerely Yours,
Haifeng Li
