#### **SPECIFIC COMMENTS TO AUTHORS**

This article reported an interesting case. An elderly male presented with simultaneous multisystem lesions of the gallbladder, pancreas, arteries, and salivary glands was diagnosed with IgG4-related disease. I have some suggestions for the authors. 1. Only the pathological results of the right mandible mass was mentioned in the article. It would be nice to have other histopathological examinations. It is recommended to add immunohistochemical staining of IgG4+ cells. 2. The lung and kidney are common sites of involvement in IgG4-related diseases. Regardless of whether the patient has lung and kidney lesions, the relevant examination reports should be available.
