SPECIFIC COMMENTS TO AUTHORS

This is an interesting case report about a preterm neonate with congenital maxillofacial hemangioma presenting with congestive heart failure and thrombocytopenia. It is concisely written with good illustrations. A review for possible typos is recommended. Overall, this manuscript provides interesting news, is concisely written and can be published in the present form.

Thank you very much for reviewing our manuscript. We have read through the manuscript and corrected the typos.

SPECIFIC COMMENTS TO AUTHORS

please describe the novelty and focus discuss on it

Response: We have rewritten the discussion and conclusion section.

Congenital hemangiomas are significantly different from typical hemangiomas in terms of the clinical manifestations, staging, pathology and imaging. Moreover, congenital hemangiomas also have different types, NICH, RICH and PICH. The treatment strategies, incidence of complications, and long-term prognosis are also different, therefore, it is crucial to differentiate the different types of congenital hemangioma. The differentiation can be achieved according to the clinical characteristics of the different types, a color Doppler ultrasonography, imaging and pathology. Based on the specific type, a specific treatment strategy should be applied. Currently, the common complications of congenital hemangioma include; intralesional hemorrhage, thrombocytopenia, abnormal coagulation function, congestive heart failure, etc. For our case, we focused on, limiting liquid intake, inhibiting further growth of the hemangioma, improving the congestive heart failure, improving heart function, supplementing hemoglobin, preventing bleeding, and selecting the timing for the surgery. Furthermore; collaborating among multi-disciplines, coordination of care for the tumor and incision prior and after the operation, averting postoperative complications, were all instrumental in increasing the probability of a good long-term prognosis.
