### **SPECIFIC COMMENTS TO AUTHORS**

1. Is the sample representative of the general population? 2. Is the data expected to be robust / homogenous with regard to missing numbers under each variable? 3. Was a subgroup analysis between the single vs multiple bleeders, dead vs live, no of transfusions considered? 3. Was a co-relation with the final outcome (better/rebleed/death) considered ? 4. Was the effect of time over change in lifestyle / alteration in variables taken into consideration? 5. In case of Education a different way of categorisation (ug /pg /etc) could have been better 6. The reliability of self-quantification smoking / alcohol is of concern 7. Was the bearing of modifications in lifestyle on prevention / altering risk taken into consideration 8. Several statistical data sets / graphs are included without elaborate discussion of the contents (supplemental fig 2, table 3)

### **SPECIFIC COMMENTS TO AUTHORS**

This is an interesting and well-written paper. Several minor suggestions for revision are listed below: 1. The paper requires a minor polishing of the English language. Use at least Grammarly. 2. Please add the approval number of the ethics committee (I know this is a secondary database). 3. The consumption of coffee seems unrealistic to me: how can someone consume 6-10 or >10 cups of coffee per day? Which volume of coffee was taken into account? 4. The anticancerous effects of coffee consumption can be further detailed in the Discussions. It contains a large amount of flavonoids which have antineoplastic effects. Look for meta-analyses of this subject.
