SPECIFIC COMMENTS TO AUTHORS

This is an interesting clinical case, which is very rare, suggested by the authors. Although the case didn't seem to be very complicated, the diagnosis and/or differential diagnosis is pretty challenge. The coverage/content of the manuscript is about the right length, considering this is a case report. The literature is also sufficient to support their findings and discussion. Only one point should be clarified, i.e. why there was necessity to have CT scan in the first place, because it was very minor injury at the beginning from clinician point of view? please justify it.
