SPECIFIC COMMENTS TO AUTHORS

The incidence of fetal distress, polyhydramnios, puerperal infection, premature delivery, and macrosomia in pregnant women with GDM are higher than in those without GDM. However, there are no effective measures to avoid the adverse outcomes of older-age pregnancies, especially those with GDM. In this study, the delivery mode and neonatal Apgar score of pregnant women with GDM at different ages were compared, to improve the pregnancy outcome of the older pregnant women, and provide a reference for ensuring the effect of eugenics and prenatal care. The study is very well designed and the results are very interesting. Comments: 1. The manuscript requires a minor editing. 2. References should be edited and updated according to the journal's guidelines. 3. Figure 2 is too small, please update the image.

SPECIFIC COMMENTS TO AUTHORS

This is a very interesting study of the relationship between age of pregnant gestational diabetes mellitus women and mode of delivery and neonatal Apgar score. The study is very well designed and the methods are described in detail. Results are interesting. After a minor editing, it can be accepted for publication.
