## SPECIFIC COMMENTS TO AUTHORS

VEGF is a cytokine that specifically enhances vascular permeability, promotes neovascularization and participates in neuroprotection and other biological functions. The effect of VEGF and Cor on serological parameters in patients with hypertensive cerebral hemorrhage remains unclear. In this study, the authors investigated the usefulness of serum VEGF and Cor expression in predicting the prognosis of patients with hypertensive cerebral hemorrhage. The study is well designed and the results are interesting. Comments: 1. There are some minor language polishing should be corrected. 2. The authors should describe the results in the main text. Not only list the data in the tables. 3. Please delete redundant references, such as "Cerebral hemorrhage is a common and severe complication of hypertension in middle-aged and elderly men[1-15].". Only 2-3 most important references are enough. 4. The discussion should be deeper.

## SPECIFIC COMMENTS TO AUTHORS

This brief study of the serum VEGF and Cor expression to predict prognosis of patients with hypertensive cerebral hemorrhage are interesting. The manuscript requires a minor editing. A minor language polishing should be revised, and the discussion should be enlarged.
