

## PEER-REVIEW REPORT

**Name of journal:** World Journal of Gastroenterology

**Manuscript NO:** 49124

**Title:** Exploring the hepatitis C virus genome using single molecule real-time sequencing

**Reviewer's code:** 01548565

**Reviewer's country:** China

**Science editor:** Jia-Ping Yan

**Reviewer accepted review:** 2019-05-19 01:32

**Reviewer performed review:** 2019-05-20 08:40

**Review time:** 1 Day and 7 Hours

### SPECIFIC COMMENTS TO AUTHORS

SMRT sequencing can directly demonstrate linkage of nucleotide changes over a span of more than 20 kbp, and thus can be applied to directly examine the haplotypes of viruses or bacteria whose genome structures are changing in real time. As the result, SMRT sequencing has been applied in various studies of viral genomes including

determination of the full-length contiguous genome sequence of hepatitis C virus (HCV), targeted deep sequencing of the HCV NS5A gene, and assessment of heterogeneity among viral populations. Recently, the emergence of multi-drug resistant HCV viruses has become a significant clinical issue and has been also demonstrated using SMRT sequencing. In this review, the author introduces the novel third-generation (SMRT sequencing) PacBio RSII/Sequel systems, compares them with conventional next-generation sequencers, and summarizes previous studies in which SMRT sequencing technology has been applied for hepatitis C virus genome analysis. In addition, another long-read sequencing platform, nanopore sequencing technology, was introduced, and the advantages, limitations, and future perspectives in using these third-generation sequencers for HCV genome analysis are discussed. As the results, the conclusion is accepted.

### SPECIFIC COMMENTS TO AUTHORS

This review shows that PacBio RS II platform combined with circular consensus sequencing (CCS) can reliably provide data for full-length HCV genome sequencing analysis, especially to detect resistance-associated substitution (RAS) for DAA treatment failure.
