Paraneoplastic pemphigus and myasthenia gravis, associated ...

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4974432>

Paraneoplastic pemphigus (PNP) is an autoimmune blistering disease **associated** with neoplasms.The disease is most commonly of lymphoproliferative origin and presents high mortality. We describe a patient with PNP and myasthenia gravis **associated with inflammatory pseudotumor-like follicular dendritic cell sarcoma**, as well as the response to rituximab.

<https://www.sciencedirect.com/science/article/pii/S2210740120301509>

Follicular dendritic cell sarcoma (FDCS) can be divided into the conventional type, and the **inflammatory** pseudotumor (IPT)-like variant type. Epstein-Barr virus (EBV) infection is considered to be closely **associated** with the pathogenesis of IPT-like variant of FDCS.

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5836680>

Background. B-cell zones within lymph nodes can exist as primary or secondary follicles. 1 The former is

Follicular dendritic cell sarcoma

Extremely Rare Neoplasm

Follicular dendritic cell sarcoma is an extremely rare neoplasm. While the existence of FDC tumors was predicted by Lennert in 1978, the tumor wasn't fully recognized as its own cancer until 1986 after characterization by Monda et al. It accounts for only 0.4% of soft tissue sarcomas, but has significant recurrent and metastatic potential and is considered an intermediate grade malignancy. The major hurdle in treating FDCS has been misdiagnosis. It is a newly characterized cancer, and because of its similarities in presentation and markers to lymphoma, both Hodgkin and Non-Hodgkin subtypes, diagnosis of FDCS can be difficult. With recent advancements in cancer biology better diagnostic assays and chemotherapeutic agents have been made to more accurately diagnose and treat FDCS.
