In this review, Vujcic et al. have presented liver-related risk factors that could influence outcomes of COVID-19 infection and, to lesser extent, highlighted how COVID-19 may affect liver physiology from the recent literature. Although this piece of work is well written and includes major reports related to the topic, I'm afraid that the contents of this article are already reviewed elsewhere and thus represent redundancy (e.g. Marjot et al., 2021 PMID: 33692570; Dufour et al., 2022 PMID: 35701093; Du et al., 2022 PMID: 34428501; Ozkurt & Tanriverdi, 2022 PMID: 35211548; McConnell et al., 2022 PMID: 34658172 and Aio, 2022 PMID: 35023684). In fact, some of these previous works provide more comprehensive details related to the topic. The authors should find a new focus regarding COVID-19 and liver diseases to distinguish or elevate this work from others.

SPECIFIC COMMENTS TO AUTHORS

The review is up-to-date, well-written, and contains relevant references without self-citation. However, as the review claims to be exhaustive, it is recommended to include data on COVID-19 outcomes in autoimmune/cholestatic liver disease (AIH, PBC, and PSC), expand the HCC subsection, and add data from large national studies (e.g., Mallet V. et al., 2021). The manuscript is recommended for publication after a minor revision.
