1 What did this study explore?

This study evaluated the efficacy and safety of liquid nitrogen cryotherapy as a primary or rescue treatment for Barrett's esophagus, with and without dysplasia, or intramucosal carcinoma.

2 How did the authors perform all experiments?

All patients who had undergone liquid cryotherapy for treatment of Barrett's esophagus during the study period were included and evaluated to assess the efficacy and safety of liquid nitrogen cryotherapy.

3 How did the authors process all experimental data?

All patients were included in data analysis. Charts were reviewed for endoscopic and pathologic correlation.

4 How did the authors deal with the pre-study hypothesis?

This study was an exploratory analysis of retrospective data.

5 What are the novel findings of this study?

This study confirms, in a large cohort, long term pathologic response of liquid nitrogen cryotherapy.

Thank you again for publishing our manuscript in the *World Journal of Gastroenterology*.

Sincerely yours,

Peter Laszlo LAKATOS, MD, PhD
