COMMENTS TO AUTHORS

This is retrospective analysis of the prevalence of AKI following partial hepatectomy. A variety of risk factors which are predictive for this complication have been analyzed. Although the study has the weakness of being retrospective the clinical information derived from a large number of cases (446 hepatectomies) is of interest. English should be improved and abbreviations should be used more restrictively. Specific points: In the introduction the following sentence has no clear meaning: "the current criteria suggested by the "International Ascites Club" for definition of AKI in cirrhotic patients do not include unreal measurements for these patients[10], such as urine output and static serum creatinine (sCr) levels, and apparently would be the most appropriate criteria in these situations" In Table 3 the number of resections should be 446 and not 466.

COMMENTS TO AUTHORS

This paper was retrospectively analysed the clinical data, and found some risk factors of acute kidney injury. Do have some valuable in clinic. The material was rich, the result was reasonable, and the discussion did have some valuable information. But for the paper writing, we should use author to instead of we, our and so on.
