Changing landscape of hepatitis C virus-positive donors

Catherine E Kling, Ajit P Limaye, Lena Sibulesky

Abstract

With the introduction of the new highly effective antiviral therapies, there has been a dramatic increase in the use of the HCV-positive livers in HCV-positive recipients. In the majority of studies, HCV positivity was defined as a donor testing HCV Ab positive. In 2015, all Organ Procurement Organizations were mandated to perform and report HCV NAT results on all deceased and living donors. Studies are not yet available on how organs are being utilized based on NAT status and whether NAT status affects recipient outcomes. Further studies are needed to maximize the use of these organs.
