作者: G La Manna

In 2011, the U.S. Food and Drug Administration (FDA) approved the introduction of direct-acting antiviral agents (DAAs) for the treatment of chronic HCV. DAAs consist in a group of small molecules that target the nonstructural viral proteins NS3, 4A, 4B, 5A and 5B. The administration of DAAs represents a new and effective ...

Hepatitis C and renal transplantation in the era of new antiviral agents

Maurizio Salvadori, Aris Tsalouchos

Abstract

Data from WHO estimates that the HCV prevalence is 3% and approximately 71 million persons are infected worldwide. HCV infection is particularly frequent among patients affected by renal diseases and among those in dialysis treatment. In addition to produce a higher rate of any cause of death, HCV in renal patients and in renal transplanted patients produce a deterioration of liver disease and is a recognized cause of transplant glomerulopathy, new onset diabetes mellitus and lymphoproliferative disorders.
