Retrospective Study

Prevalence and clinical characteristics associated with left atrial thrombus detection: Apixaban

Hoyle L Whiteside, Arun Nagabandi, Kristen Brown, Deepak N Ayyala, Gyanendra K Sharma

Abstract

BACKGROUND (no more than 100 words) The prevalence of left atrial appendage (LAA) thrombus detection by transesophageal echocardiogram (TEE) in patients with non-valvular atrial fibrillation (AF) anticoagulated with apixaban is not well defined and identification of additional risk factors may help guide the selection process for pre-procedural TEE. The purpose of our study was to retrospectively analyze the prevalence of left atrial appendage (LAA) thrombus detection by transesophageal echocardiogram (TEE) in patients continuously anticoagulated with apixaban for ≥ 4
