This paper only discussed the clinical feature of 5 patients of PJS who were diagnosed by clinical criteria only. The importance of PJS in clinical practice lies on its increased risk of associated malignancy. The authors did not included on these data, thus it contribute little to the science.

In this retrospective case series, the authors aimed to assess the clinical characteristics, diagnosis and treatment of malignant change secondary to Peutz-Jeghers Syndrome (PJS). They concluded that endoscopy combined with CT was significantly important in the diagnosis and treatment of PJS, pathological examination and gene detection were the gold standards for detecting malignant change secondary to PJS, and surgery could be preferred for endoscopically unremovable malignant polyps. The cases are well-documented and adequately written in detail. I congratulate the authors for their successful work.
