**Do liver metastases from gastric cancer contraindicate aggressive surgical resection?**

**A 14-year single-center experience**

Yazawa T *et al.* LR for LMGC

## Abstract

### BACKGROUND

Advanced gastric cancer (GC) with liver metastasis is often characterized by multiple and bilobular metastases and may also be associated with extrahepatic metastatic lesions. Hence, many physicians consider that radical surgeries are contraindicated for liver metastases from GC (LMGC). According to the 2017 Japanese treatment guideline for GC, a smaller number of liver metastases without unresectable factors may be an indication for liver resection (LR) with curability. The actual 5-year overall survival (OS) rate ranges from 0 to 0.37.

### AIM

To present the institutional indications for LR for LMGC and identify important factors for prognostic outcomes.
