SPECIFIC COMMENTS TO AUTHORS

It is a well written case report of Abdominal Aortic Thrombosis as Initial Presentation of COVID-19 Infection in a 60 year old man. Please clarify if the patient had no any other symptom indicative of an infection and more specifically COVID-19 disease. Please discuss alternative treatments to Tocilizumab or if more doses of this medicine could be administered in a patient with extensive located thrombosis.

SPECIFIC COMMENTS TO AUTHORS

Abdominal Aortic Thrombosis as Initial Presentation of COVID-19 Infection: A Case Report, Webster et al., 2020 This is a case report of aortic thrombosis as initial presentation of COVID-19. As a short report, some clinical details may be missing. I have few suggestions for improving this timely and clearly written article. Possibly you could expand Introduction to include similar literature on aortic thrombosis and a potential hypothesis of hypercoagulability caused by virus infection.

SPECIFIC COMMENTS TO AUTHORS

The case report on abdominal aortic thrombosis as an initial presentation of COVID-19 infection is very interesting and actual, however there are some points that need to be answered before publication: - When was the diagnosis of Covid-19 established? How? With PCR or serotesting? - The patient was treated with tocilizumab. Was antiviral therapy used in this case? If yes, which one? Or which combination? - Was the patient treated with LMWH and /or low dose aspirin / clopidogrel ? - It is known that the replication of SarsCoV2 virus is linked to fat metabolism. Fenofibrate or other fibrates/statins were used in this case? - Is there a possible link between fat metabolism and hypercoagulability? After major revision I suggest to reconsider the manuscript for a possible publication.

SPECIFIC COMMENTS TO AUTHORS

Abdominal Aortic Thrombosis as Initial Presentation of COVID-19 Infection: A Case Report William Z. Webster et al Reviewer's comments This manuscript described a rare but serious complication associated with COVID-19. In order to make a correct diagnosis and an appropriate treatment in patients with COVID-19 thrombotic events is important. The author can mention about the following points. #1 The patient reported here received heparin infusion. The authors should explain the reason for the selection of heparin, not but DOAC. #2 The value of D-dimer in the two references is not correct; The values from the original papers were written on the left side and converted to $\mu\text{g/ml}$ were on the right side. A. Le Berre. et al "serum D- dimer level of 17280 ng/mL (Normal < 250 ng/mL)" =17.28 $\mu\text{g/ml}$ Katchanov, Juri, et al "D-Dimer 15 280 $\mu\text{g/l}$ (normal < 500 $\mu\text{g/l}$)" = 15.28 $\mu\text{g/ml}$
