<https://americanaddictioncenters.org/inhalant-abuse>

People who **abuse** inhalants can suffer heart failure due to tissue death or overstimulation of the **muscle**, or they can suffocate because inhalants are absorbed in the lungs faster than oxygen and end up displacing oxygen. Sudden heart failure due to inhalant **abuse** is known as sudden sniffing death syndrome, and it can occur with first-time use.

Inhaling muscle spray: A rising trend of abuse

Sohil Pothiwala, Chong King Yong, Rabind Charles

Ethyl chloride was popular as an inhalant recreational drug in the 1980s. It is easily available in pharmacies as well as sold online as a topical anesthetic spray for pain relief. In recent times, its use is gaining popularity again among the youth as an inhalant drug due to its neuro-stimulatory effects. To avoid the risks associated with use of illegal drugs, and ease of availability of ethyl chloride without restrictions, there is a rising trend to use it as a "substitute" drug of abuse. In this paper, we try to highlight to the critical care and emergency physicians that majority of these cases present with predominant neurological symptoms, with occasional involvement of the cardiovascular system. The

Parents: Know about Inhalant Abuse - Poison

<https://www.poison.org/articles/2007-jun/parents-must-know-about-inhalant-abuse> ▾

Inhalant abuse means trying to get high by breathing in vapors, fumes, or aerosol sprays. Thousands of products can be abused by inhaling. These are ordinary household products – and they are poisons. Nearly 20 percent of eighth-graders admit to abusing inhalants, but most parents don't even know about it. Inhalants can kill - even the first ...
