### Hepatitis C (HCV) Genotype: Your Questions Answered

<https://www.healthline.com/health/hepatitis-c-genotype-expert>< **Hepatitis C Has Different "...** What's The Difference Bet... What Is Th >

Hepatitis C virus (HCV) is a single-stranded RNA virus. That means the **genetic code** of each virus particle is contained within one continuous piece of the **nucleic acid RNA**. Every strand of a nucleic acid (RNA or DNA) is made up of a chain of building blocks. The sequence of these blocks determines the proteins that an organism requires, whether it's a virus, plant, animal. Unlike HCV, the human g...

**Genotype 3 - HCV's last line of defense**

GT3 HCV last line of defense

**Abstract**

Chronic infection with hepatitis C virus (HCV) is one of the leading causes of liver disease globally, affecting approximately 71 million people. The majority of them are infected with genotype (GT) 1 but infections with GT3 are second in frequency. For many years, GT3 was considered to be less pathogenic compared to other genotypes in the HCV family due to its favorable response to interferon (IFN)-based regimen. However, the growing evidence of a higher rate of steatosis, more rapid progression of liver fibrosis, and lower efficacy of antiviral treatment compared to infection with other HCV genotypes has changed this perception.

<https://www.hepatitis.va.gov/hcv/patient/diagnosis/...>

Aug 15, 2019 · The hepatitis C genotype is a type or "strain" of hepatitis C virus. There are 6 genotypes of hepatitis C around the world. In the United States, 3 genotypes are common: Genotype 1; Genotype 2; Genotype 3; These can be further specified as: Genotype 1a or 1b; Genotype 2a or 2b or 2c; Genotype 3a or 3b; A person's hepatitis C genotype does not ...
