Abdominal Compartment Syndrome among Medical ...
https://www.atechopen.com/online-first/abdominal-...
Abdominal compartment syndrome and intra-abdominal hypertension (IAH) has been widely studied in surgical and trauma patients, even though the incidence of IAH in medical intensive care unit (MICU) remains high. Studies have shown that the time to decision making regarding diagnosis and management of IAH is twice in MICU compared to the corresponding surgical side.

2021-3-5 - Abdominal compartment syndrome compresses the inferior vena cava (IVC), making it look empty. This may lead to erroneous decisions regarding fluid administration. Avoid intubation of patients with baseline abdominal compartment syndrome if possible (presentation of the thorax may increase intra-abdominal pressure).

BACKGROUND: Abdominal compartment syndrome (ACS) has a reported incidence of 9%-14% among trauma patients. However, in patients with similar hemodynamic changes, the incidence of ACS remains unclear. Our aim was to determine the incidence of ACS among patients undergoing endovascular aortic repair (EVAR) for ruptured abdominal aortic aneurysms.

Abdominal compartment syndrome among surgical patients

Leon M *et al.* Abdominal compartment syndrome

Monica Leon, Luis Chavez, Salim Surani

Abstract

Abdominal compartment syndrome (ACS) develops when organ failure arises secondary to an increase in intraabdominal pressure. The abdominal pressure is determined by multiple factors such as blood pressure, abdominal compliance, and other factors that exert a constant pressure within the abdominal cavity. Several conditions in the critically ill may increase abdominal pressure compromising organ perfusion that may lead to renal and respiratory dysfunction. Among surgical and
