#### **SPECIFIC COMMENTS TO AUTHORS**

This is a well designed and hard worked study, but on a well known and established findings. The additional yield of NBI over conventional white light endoscopy is documented by many studies both Hp and IM separately. Thus novelty of the article is limited. This study combined Helicobacter pylori and precancerous findings. The separation of intestinal metaplasia as complete or incomplete form should not be evaluated in same data. A note regarding this issue will be better. Best regards

#### **SPECIFIC COMMENTS TO AUTHORS**

Very interesting article, comparing endoscopic diagnostic between standard and M-NBI endoscopy for H.pylori infection. This article is valuable, because there are no guidelines for detection H.pylory infection by M-NBI so far. This diagnostic method could be very useful in therapeutic decision-making, endoscopic treatment process and follow up examination of these patients. The authors also analyzed the degree of gastric atrophy ,intestinal metaplasia and level of serum pepsinogen, which make this study the first whit that kind of design. The manuscript meet the requirements of biostatistics.
