Abstract. Background: Surgical site infections (SSIs) are wound infections that occur after an operative procedure. A preventable complication, they are costly and associated with poorer patient outcomes, increased mortality, morbidity and reoperation rates. Surgical wound irrigation is an **intraoperative technique**, which may reduce the rate of SSIs through removal of dead or damaged tissue, metabolic ...

[Intra-Cavity Lavage and Wound Irrigation for Prevention of ...](#)

<https://pubmed.ncbi.nlm.nih.gov/32352895>

Intra-operative surgical site irrigation and intra-cavity lavage may reduce the risk of SSIs through removal of dead or damaged tissue, metabolic waste, and site exudate. Irrigation with antibiotic or antiseptic solutions may further reduce the risk of SSI because of bacteriocidal properties.

PEOPLE ALSO ASK

Is there evidence for the use of wound irrigation?

4,890,000 Results Any time

Surgical site infections arise from contamination of the surgical site in the period of time between incision and closure. **Wound irrigation** aims to physically remove or dilute surface bacteria and exert antimicrobial action when an antiseptic or antibiotic agent is selected.
