SPECIFIC COMMENTS TO AUTHORS

Dear authors, I do not have many specific comments on your manuscript. Melatonin in schizophrenia seems to be a good option if you need to treat insomnia and do not want to increase the dosis of antipsychotic medication (and adverse effects of antipsychotics). My question is: If you give melatonin in schizophrenia for a long time, e.g. for several months, will the efficacy of melatoini be the same, or will it gradually decrease (similarly to other psychotropic medication in mental disorders)? Best regards The reviewer
