**Management of afferent loop obstruction: Reoperation or ...**  
<https://pubmed.ncbi.nlm.nih.gov/26425267>  
Surgery includes: (1) adhesiolysis and reconstruction for benign causes; and (2) by-pass or excision and reconstruction for malignant causes. However, endoscopic enteral stenting, transhepatic percutaneous enteral stenting and direct percutaneous tube enterostomy have the principal role in management of malignant and radiation-induced obstruction.

**Management of afferent loop obstruction: Reoperation or ...**  
<https://europepmc.org/articles/PMC4582236> •  
Sep 01, 2015 Core tip: Management strategy of afferent loop obstruction (ALO) depends on: (1) the benign or malignant nature of the obstruction. ALO caused by a benign lesion needs definitive repair of the primary cause by surgery. ALO caused by a malignant lesion needs palliative treatment (percutaneous and endoscopic interventions, by-pass surgery) or excision; and (2) the site of obstruction.

**Management** for patients with **afferent loop** syndrome can largely subdivide according to underlying etiology. For most benign causes, surgery usually provides definitive treatment. In the setting of **malignancy**, initial neoadjuvant **management** may be followed by surgical treatment with curative/palliative intent.
