A **study** on **induced pluripotent stem cells** (iPSCs) showed that exocrine **pancreatic cells** from patient's iPSC can serve as a **model** for **studying** the pathogenesis of **drug-induced pancreatitis**, which may help to further investigate the pathogenesis of **drug-induced pancreatitis**. Diagnosis of **drug-induced pancreatitis**

<https://pubmed.ncbi.nlm.nih.gov/28782468>

Among the technologies that could provide **innovative disease models**, **induced pluripotent stem cells** (iPSCs) is one of the most promising. Indeed, one application of this technology is patient-specific **disease modeling**. iPSCs obtained by reprogramming patients' cells collected from accessible tissues, have the unique capability to differentiate, under an adequate stimulus, into any human cell type.
