&lt; Introduction Materials and Methods Results Discussion At &gt;

Hepatic perivascular epithelioid cell neoplasm(PEComa) is a rare mesenchyme-derived neoplasm that is primarily composed of histologically distinctive perivascular epithelioid cells (PECs), which share the expression of the monoclonal antibody, HMB-45, smooth muscle cell markers and/or the melanocytic differentiation marker, Melan-A (1). In the majority of hepatic PEComas, adipocytes may also be found intermingling with PECs in varying proportions (2). Larger tumors may have necrosis, or be...

May 21, 2021 · INTRODUCTION. Angiomyolipoma (AML) is a solid mesenchymal tumor, mainly described in the kidney, and belongs to the group of perivascular epithelioid cell tumors (PEComas) [1]. Hepatic localization of AML, described for the first time in 1976 [2], is rare, since only around 600 cases were reported after an exhaustive search of the literature up to the year 2017 [3].
