

Reviewer #1:

1. The prevalence of hypertension before kidney transplantation is not mentioned. I suppose, most of the patients are already hypertensive before the surgery and in most of them only chronic hypertension returns and in less patients develop new hypertension.

Thank you for your comments

We have added a new reference and mentioned the prevalence of hypertension in end stage renal disease patients before transplantation.

2. Although there is a “Medical Management” section, there is also a paragraph on page 9, starting from line 14. It should be incorporated into the “Medical Management” section.

We have discussed specific management for some transplant organs as the literature reported specific information regarding medication management for specific organs

3. A short “Conclusions” section is missing from the end of the manuscript with the final take-home messages of the paper

Conclusions was added

4. In the first sentence of Introduction, the threshold limit of hypertension is stated to be 140/80 mmHg, which requires correction.

It was corrected and added reference

5. On page 7, line 8: “endothelial-A receptor” is endothelin receptor type A?

Corrected

6. Spaces are often missing after citation inserts, which requires correction.

Corrected
