

Statistical Review Statement

We confirm that the manuscript **“Inflammatory Response in Confirmed Non-Diabetic Foot and Ankle Infections: A Case Series with Normal Inflammatory Markers”** has been statistically reviewed and that the results presented utilised appropriate and relevant statistical methods for its purpose.

Sensitivity analysis was utilised for assessing accuracy of different inflammatory markers in non-diabetic foot and ankle infections with standard statistical methods. All statistical analysis was performed using SPSS (version 16) with professional statistical input sought from biostatistics department, University Hospitals of Leicester, UK.
