

## PEER-REVIEW REPORT

**Name of journal:** *World Journal of Gastrointestinal Endoscopy*

**Manuscript NO:** 79805

**Title:** Optimal traction direction in traction-assisted gastric endoscopic submucosal dissection

**Provenance and peer review:** Invited Manuscript; Externally peer reviewed

**Peer-review model:** Single blind

**Reviewer's code:** 03479301

**Position:** Editorial Board

**Academic degree:** MD, PhD

**Professional title:** Assistant Professor, Chief Doctor

**Reviewer's Country/Territory:** China

**Author's Country/Territory:** Japan

**Manuscript submission date:** 2022-09-07

**Reviewer chosen by:** AI Technique

**Reviewer accepted review:** 2022-09-07 09:08

**Reviewer performed review:** 2022-09-13 07:09

**Review time:** 5 Days and 22 Hours

**SPECIFIC COMMENTS TO AUTHORS**

This is a very useful review on ESD procedure and is recommended for publication.

### **SPECIFIC COMMENTS TO AUTHORS**

This minireview discussed the use of traction in gastric ESD and the optimal direction of traction, which had received little attention at present. I think the content of the article is novel and provides new inspiration for clinical work and scientific research. I agree with the author that vertical traction does have an advantage in small lesions during ESD; However, in larger lesions, vertical traction may not meet clinical needs and two or more traction devices may be required. I have an idea for this question, is there a range of optimal traction directions that vary depending on the size of the lesion? Of course, this is just my personal idea, put forward to communicate with the author here, thank you!
