SPECIFIC COMMENTS TO AUTHORS

In this article, the authors reported two Chinese HIV-HBV co-infected patients with end-stage liver disease who underwent A to O brain dead donor liver transplantation and reviewed the literature on HIV-HBV co-infected patients treated with ABO-compatible liver transplantation. Their results showed that patients showed undetectable HIV viral load, CD4(+) T cell counts greater than 200 cells/ μ L, no HBV recurrence, and stable liver function after intermediate-term follow-up and both patients survived at 36-42 months of follow-up. Several suggestions: 1. In the [core tip], [We reported two Chinese HIV-HBV coinfectd patients]. However, no HBV information is mentioned in patient [case 2]. 2. Please check the typo-errors in the entire manuscript, such as the space between words, e.g. [agood].
