SPECIFIC COMMENTS TO AUTHORS

This review shows the resistance of bacteria against multidrug in human so it's best understanding of cirrhosis for young researchers.

SPECIFIC COMMENTS TO AUTHORS

This manuscript deals with the impact of multidrug resistance on the management of bacterial infections in liver cirrhosis. In this narrative review, the authors cite many studies on epidemiology, prognostic impact, risk factors, and management. It may be supposed that the collection is not complete, but that the most relevant studies are cited. The manuscript is well written. However, I suggest some corrections or improvements. The give a better overview about the studies, I suggest to include a Table with bibliographic data and the most important details of the studies. This would facilitate the readability of the manuscript and could better guide the reader to draw his own conclusions. “The “ESKAPE” pathogens (Enterococcus faecium, Staphylococcus aureus, Klebsiella pneumoniae, Acinetobacter baumannii, Pseudomonas aeruginosa, and Enterobacteriaceae species) remain to be leading causes of MDR (multidrug-resistant) infections throughout the world and were designated by the Word Health Organization as “priority organisms” to focus and guide research and development related to new antibiotics(1)” Against which antibiotics are these ESKAPE pathogens resistant? Is there an emergence of new resistant strains, e.g. E. faecium? Please give more details on this problem. Several time, the authors mention standard treatment or classical antibiotic treatment. Please give details: What is standard? What is “not standard”? Figure 1 not informative, if the Figure does not differentiate between different countries. There is surely a gradient e.g. in North – versus South America, or between Central Europe and Russia. Why are MDRO so frequent in China? The suggestions for diagnostic measures and particularly for therapy are too general. Would the authors give recommendations for choice of antibiotics? Carbapenems? Vancomycin? Piperacillin/Tazobactam? 4th

generation cephalosporins? Newer antibiotics? “Reports from the United States and Europe estimate a death toll of 29.000-33.000 patients each year, with a huge attributable healthcare cost(2-4)”. Does this number refer to MDRO or PDRO or both combined?

SPECIFIC COMMENTS TO AUTHORS

Probable due to a technical problem, the Tables and Figures cannot be read in the present docx version. Please send a new version. Maybe PDF would be better??
Generally, I recommend publication. However, I must see a correct version before.
