**SPECIFIC COMMENTS TO AUTHORS**

The manuscript has the potential to publish, as the author presented valid observations of positive OV individuals closely associated with common risk factors such as the smoking status and alcohol consumption were delivered in the manuscript. However, there are still rooms for improvement to enhance the visibility and quality of the work.

The following are comments from my point of view for a manuscript entitled, “Review manuscript: Polymorphism of genes encoding drug-metabolizing and inflammation-related enzymes for susceptibility to cholangiocarcinoma in Thailand”. 1.

The methodology was comprehensively described in the manuscript, however, the associated with each of the inflammation genes and the well-known metabolizing enzymes were highly due to the small sample size in the study. 2. If the statement or inclusion criteria of normal alpha fetoprotein are not the main contributor variable in the study, please remove. Else, there is no point mentioning in the manuscript. 3. Were the blood samples stored at -80C before DNA extraction? Why was it not extracted immediately after? Or was the DNA that was stored at -80C? 4. Please emphasis the basis of assessing the inflammation genes polymorphisms with CCA. And the link

between the carcinogen infection was unclear to correlate it with CCA and the inflammation markers. Need to justify the purpose.

**SPECIFIC COMMENTS TO AUTHORS**

Dear Authors, I believe you and your team have put tremendous work into this collaboration, studying and collecting data overseas. Your study is interesting and worth to be studied further. The possibility of CCA could be caused by OV and external factors (e.g. carcinogens or chemicals). Authors found no significant association of CCA with polymorphisms of drug metabolizing enzyme and inflammation-related genes. Perhaps, authors should state why CYP2E1 was tested, as there are other human CYPs that could be carcinogen-activating enzyme e.g. CYP4B1. Based on your manuscript, understand that this is a continuous study, the cases of CCA collected were dated back to 1999-2005, perhaps authors could compare data with the current population? I am not well-versed with case study manuscript, but it would be good if authors could provide the conclusion after the discussion section, limitations of your study and future work. All the best, keep up the good work. Thank you
