Columns: Editorial

Morbus Menière - Were the last 50 years of molecular biological research fruitless for Menière's Disease?

1. The Naganawa group and their developed imaging protocols for endolymphatic hydrops were mentioned and added to the references.
2. The endolymphatic sac surgery is not the primary option and most used technique in many centres, so that it consequently was not further discussed in this editorial.
3. A metaanalysis by Cohen-Korem et al. was added to the references.
4. The importance of counseling and the accompanying psychological effects for Meniere's Disease were already discussed in the manuscript.
