COMMENTS TO AUTHORS

This work is alright to publish. However, more relationships of diameter other than age should be presented. Relationships of diameter and say, gender, patient weight and height are suggested.

Re: Thank you! According to checking the literature, the main factors to common bile duct is age, cholecystectomy, fatty meal, gender, patient weight and height, BMI, breath, and so on. In this study, we study the asymptomatic population, so we excluded the cholecystectomy. All the literature we know reports the fatty meal is not influence the diameter, so we do not study the factor. In future, we will present more factors.
