

Answering Reviewers.

1. I have created a summary table as suggested detailing the pathophysiology and imaging features of all the main types of dementia that has been discussed in the text. Where relevant references have been cited. Explanation for the various acronyms in the table has been explained in the accompanying legend in alphabetical order.

This provides an overview of the varying features of the different types of dementia at a glance.

2. One or two figures summarising the pathophysiology and the imaging features was also recommended. While it is difficult to depict all different forms of dementia on a single anatomical model, a figure depicting the differences in the regions involved in FTD and AD has been added.

I hope this would satisfy the reviewer.

I am happy to receive a feedback and any further suggestions.
