

Answers to the reviewers:

#### **COMMENTS TO AUTHORS**

Authors could share their experience of any case if they missed in either protocol and picked in another protocol (or picked up the lesion in low radiation low iodine protocol)

**Answer:** Thank you for your suggestion. As mentioned in the results section, in one of the patients who were scanned with both protocols we identified one hypervascular lesion measuring 5.3 cm of greatest axis that was subjectively more evident with iodixanol 270 protocol, with a CNR of 0.36 for iohexol 350 vs 2.32 for the iodixanol 270 protocol (Fig. 3).

There was no evidence of missed lesion in either protocol that was picked up in the other one.
