April 7, 2016.

Dear Editor,

We would like to submit the biostatistician review report for “Long-pulse gastric electrical stimulation promotes regeneration of the interstitial cells of Cajal in diabetic rats via IGF-1 signal pathway”.

Statistical Analysis is stated in this manuscript as follows,

Data are presented as the mean \pm SEM. A one-way ANOVA was adopted to evaluate differences among groups. The least significant difference (LSD) post hoc test was applied to compare differences between groups. A P value < 0.05 was employed as the threshold of significance. The statistical analysis was conducted using the SPSS 17.0 software.

I think that the above methods are correct after careful review.

Sincerely yours

Meixia Lu
