

Biostatistics Statement

Title: Regulatory and activated effector T cells in chronic HCV; relation to autoimmunity

Statistical Methods

Statistical Package for Social Studies (SPSS) program version 16.0.1 (SPSS Inc., Chicago, IL, USA) was used. Numerical data were expressed as mean \pm standard deviation. For comparisons between treatment groups, the null hypothesis was tested by a single-factor ANOVA for multiple groups or unpaired t-test for two groups. Comparisons were considered statistically significant if P-value < 0.05 .
